RESEARCH & RECOMMENDATION · 28 OCTOBER 2026

Let the payer be the auditor

What to build at the Africa's Talking Open & WIT Hackathon, why it should win, and whether it can become a business.

Prepared for Kevin Omondi for the hackathon on Thursday 29 October 2026, Nairobi Garage Kilimani. Builds on the 14 October reports in this folder and the ussd-pos code.

The short answer

- **Build "payer-confirmed receipts".** The person who *paid* (a tenant, a lodge guest, a chama member) dials a USSD code and confirms what they paid and to whom. The system matches that against what staff logged. A match sends the payer an SMS receipt (and, where payers need a nudge, a small airtime reward). A mismatch alerts the absent owner by SMS.
- **It goes around the wall you hit.** The hospitality idea failed on one point: the staff who steal are the ones asked to log. Here the record comes from the other side of the payment, someone with no reason to hide it. Tax authorities in Brazil and Rwanda use the same idea against shops; the Brazil study found reported retail revenue rose by at least 21% over four years.
- **It fits the judging criteria well.** It needs USSD, SMS and Airtime naturally (Voice later), it reuses your tested code, and it is a generic plugin any Africa's Talking customer can install per business, which is exactly what the Marketplace wants.
- **Start with rent, not lodges.** A tenant *wants* proof they paid the caretaker, so they confirm without a reward. A lodge guest does not care, so it costs you airtime. Lodges become the second template.
- **Be honest about the odds.** The prize is $100; the real win is a Marketplace listing and a working pilot. YC has backed about 100 African companies (about 2% of its portfolio) and took about 3 per batch after 2022, so plan on a business that earns, not on YC.

1. How this was researched

You asked for an in-depth study with real frameworks, not a list of ideas. This is what was done, so you can judge the result.

Step	Framework	What it produced
Collect	Corpus synthesis: read the primary source where it exists, then triangulate with at least one other. Each source is graded A (primary or peer-reviewed), B (reputable press or analyst) or C (vendor, promotional or single anecdote).	Funding trackers, YC portfolio and RFS, Kenya CA statistics, Brazil/Rwanda/Kenya receipt programmes, AT Marketplace and past winners (sections 2-5).
Find the pattern	Winners vs losers analysis: what did funded survivors own that dead startups did not?	Winners own a trusted record of a daily cash flow. Losers owned trucks and stock, or kept free self-reported records (section 2).
Generate ideas	Jobs-to-be-done: who is paying whom, who is absent, and who already wants a receipt?	A long list of 10 ideas, yours and new ones (section 6).
Score	The hackathon's own five criteria, 1-5 each, then a separate venture lens (who pays, evidence, crowding, regulation, your fit).	A ranked matrix (section 6).
Stress-test	Pre-mortem: assume it failed in six months, then list why. Plus kill criteria for a pilot.	Risks and mitigations (section 7.6).

2. What the money says: Africa and Kenya, 2025-2026

Measure	Figure	Source (grade)
Africa 2025, all funding	$3.2bn (Africa: The Big Deal) to $4.1bn (Partech). Trackers differ mainly on how much debt they count.	ATBD, Partech (A/B)
Debt share 2025	41% (Partech), 45% (ATBD), 46% (AVCA). A record, driven by energy and PAYG megadeals.	Partech, AVCA via Nairametrics (A/B)
Africa Jan-Sep 2026	$2.16bn, 4% below the same period of 2025. Equity up, debt down 33%: "for now, 2026 is an equity year."	ATBD Q3 2026 (B)
Kenya 2025	About $984M-1.04bn, #1 in Africa, but led by clean-energy debt (d.light, Sun King, M-KOPA, BURN).	ATBD, Partech (A/B)
Kenya H1 2026	$126M, #3 behind Egypt and Nigeria. **Equity only $46M.**	ATBD via Capital FM, Business Daily (B)
Kenyan collapses	Twiga (administration, Aug-Sep 2026), Copia (liquidation ordered 17 Sep 2026), Koko (shut 31 Jan 2026), Lipa Later, Sendy, MarketForce. Business Daily puts 13 collapsed Kenyan ventures at over KSh 93bn raised.	Court and press reports (B)

What it means for you

- **There is very little venture equity for a Kenyan software founder right now.** $46M in six months for the whole country. A product that earns from its first customers is not a fallback; it is the main route.
- **The dead companies owned physical operations.** Trucks, warehouses, agents, stock, cookstoves. Gross margin never covered fixed costs. Anything you build should stay software-light: no hardware, no inventory, no lending from your own balance sheet.
- **The survivors own a trusted record of money moving every day** (M-KOPA's repayments, Moniepoint's and Wave's transactions) and take a small cut of it. Kippa (Nigeria) had about 500k users on a free, self-reported bookkeeping app and still could not make money. The lesson for us: a *self-reported* record is

worth little; a *confirmed* record is an asset.

3. YC and Africa: what the data shows

Question	Answer	Source (grade)
How many African YC companies?	About 100 since Wave (Senegal) in 2012, about 2% of YC's 4,600+. Nigeria about 40%, Egypt about 15%, Kenya about 14%.	Condia (Jul 2026), Arab Founders, Rafiki (B)
Which sectors?	Fintech more than half. B2B SaaS about 18, consumer about 10, health about 6, industrials about 6, education about 2.	Condia, Rafiki (B; same 2024 snapshot)
Trend	Peak: 24 African startups in Winter 2022. Then 3 in W23 and 3 in W24. No African company named in any 2025-2026 batch in the sources read.	Condia, Rafiki, WeeTracker (B)
Kenyan YC companies	Triply (W24), Boya (W22), Kidato (W21), Workpay (W20), Patika/Sanifu (S22), Eden Care (S23), Fingo Africa (S21, acquired), MarketForce (S20).	vcbacked.co (B)
What YC wants now	Winter 2027 Requests for Startups: 11 items, none about Africa or emerging markets. About 60% of 2026 batch companies are AI (unsourced vendor figure).	ycombinator.com/rfs (A); agentjesse.ai (C)

Which YC requests touch Kenya

RFS item	What it asks for	Kenyan version
The $15-an-Hour Expert (Brad Flora)	"AI that turns an ordinary worker into an expert" for benefits, taxes, insurance claims, medical billing.	A clinic front-desk worker who files SHA claims correctly first time (runner-up, section 8).
Plaid for Government Benefits (Gustaf Alströmer)	A consent-based layer that pulls verified records from the source: "Verify once, apply everywhere."	Payer-confirmed payment history as a portable, verified record for credit or rent references (the long-term path of our recommendation).
AI for City Hall (Alströmer)	AI for permits, inspections, licensing, 311.	County permits and licences. Real need, but slow government sales; not a one-day build.
Own Your Intelligence (Jon Xu)	Help businesses own specialised models on their own data.	Not a fit for this hackathon.

> **Honest read on YC:** YC is a long shot for anyone in Africa right now, and its requests are written for the US. It still matters as a guide to language: "verified records from the source", "consent-based", "turns an ordinary worker into an expert". Use that language in the pitch, but do not build for YC. Build something people pay for, then apply with numbers.

4. What large organisations publish

Kenya Communications Authority, Q4 FY2025/26 (to 30 June 2026), grade A

- **27.4 million feature-phone devices** (down 3.9% in the quarter) and 52.3 million smartphones. Feature phones are about 34% of devices. These are devices, not people; one person can hold both.
- 88.0 million SIMs; 54.0 million mobile money subscriptions; Safaricom has 88.8% of mobile money transfers.
- Domestic SMS 57.1 billion a year, slightly down because of WhatsApp. USSD is not reported at all, so no official USSD usage figure exists.

Payers as auditors: three government programmes

Programme	How it works	What happened	Lesson for us
Nota Fiscal Paulista, Brazil (2007)	Shoppers give their ID on receipts, get tax rebates and lottery tickets, and can check receipts online and complain.	Reported retail revenue rose at least 21% over four years (23% in an earlier draft). After a firm's first consumer complaint it reported 7% more receipts.	It works best in high-volume, small-ticket retail. One complaint changes behaviour.
Rwanda EBM lottery (2015) and TENGAMARA (2026)	Early lottery: big prizes every four months; entry by SMS with three codes. Now: 10% of VAT back via an app, register on *562#.	The early lottery had low take-up: 40% did not know it existed and only 4% of receipts were submitted. At least 30% of people faced a "price penalty" for asking for a receipt.	People want small, frequent, certain rewards. Codes and friction kill take-up. Expect collusion through discounts.
KRA "Jinice na Risiti Legit", Kenya (Oct-Dec 2024)	Scan an eTIMS receipt QR code in an app; each receipt is one draw entry.	Ran 7 weeks; app-only. The terms cite the old Betting, Lotteries and Gaming Act.	Kenya's own version leaves out feature phones entirely. Draws bring gambling law into play.

Common language worth reusing in the pitch: "consumers as auditors", "verification at the source", "consent-based", "digital access for all", "2G meets AI" (Africa's Talking's own Women in Tech theme, June 2026).

5. What Africa's Talking and the judges reward

Fact	Detail	So what
Judging criteria	Problem & Impact; Use of AT APIs; Technical Execution; Market Readiness (published on the Marketplace); Innovation.	Score ideas on exactly these (section 6).
Marketplace terms	A "distribution and runtime layer". Vendors set pricing (once-off, hourly, monthly, yearly). Installs are billed through AT billing. The launch post says AT does not take a cut. Payout mechanics are not described.	AT's customers become your distribution. Ask AT on the day how vendors are paid.
Marketplace review	Uses AT APIs; clear onboarding; clear description; screenshots that match the features.	Budget an hour for listing, logo and screenshots.
What AT is pushing	AI agents that act over SMS, USSD, Voice and Airtime; "2G meets AI"; the Marketplace.	A small AI feature on SMS is worth adding as a stretch goal.
Voice in the sandbox	The AT AI course docs say the sandbox does **not** support voice calls; voice needs a production account and number.	Do not make the demo depend on Voice.
Past winners (Matchmakers, Jul 2026, same venue)	1st NightWeave (nightlife safety), 2nd Penzi (matchmaking with USSD for offline users), 3rd Kanga Protect (covert safety alert by USSD code, SMS to contacts).	Winners told a human story and used USSD for people without data. No judging reasons were published.

6. Ten ideas, scored

Scores are 1 (weak) to 5 (strong) on the five judging criteria. "Build" means how much of it a small team can make work in one day. These are judgement calls, explained in the notes; change any you disagree with.

Idea	Problem & impact	AT APIs	Build in a day	Market ready	Innovation	Total /25
B. Payer-confirmed receipts (new, combines your work)	4	5	4	5	5	**23**
C. Chama contribution confirmations	4	4	4	4	3	19

Idea	Problem & impact	AT APIs	Build in a day	Market ready	Innovation	Total /25
H. Milk-centre receipts (farmer confirms litres)	4	4	4	3	3	18
A. Shadow POS as it stands (staff log)	3	3	5	4	2	17
E. SHA claims assistant for clinics (AI)	5	3	2	2	4	16
F. Swahili voice agent for SACCO / clinic lines	3	4	2	3	3	15
I. School-fee confirmations for parents	3	3	4	3	2	15
J. Boda rider-owned repayment record	4	3	3	2	3	15
D. Matatu owner revenue check (till vs GPS)	4	2	2	3	3	14
G. eTIMS receipts over USSD	4	3	3	3	1	14

Notes on the scores

- **B wins on every criterion except build effort**, and even there most of the code exists in ussd-pos. C and H are really templates of B (same engine, different payer), which strengthens B's "reusable plugin" case.
- **E is the best venture idea but a poor one-day build.** SHA had Sh181.9bn of claims submitted, Sh16bn rejected and Sh31bn under review by April 2026 (The Star, 15 May 2026). Doing it well needs clinic workflows and SHA portal access you cannot fake in a day.
- **D and F lose on AT fit:** D needs M-Pesa Daraja and GPS rather than AT; F needs Voice, which the sandbox does not support.
- **G loses on innovation:** KRA already offers eTIMS options for small traders, so you would be copying the regulator.

Venture lens (beyond the hackathon)

Idea	Who pays	Crowding	Regulatory risk	Your fit
B. Payer-confirmed receipts	Owners and landlords, per unit or per confirmation	No direct private example found	Low (no draws; consent needed)	High: code exists, same customers
E. SHA claims assistant	Clinics, from recovered claims	Fairly open; Ilara restructured	Medium (health data)	Medium: needs a clinic partner
C. Chama confirmations	Chamas, small fee	Several chama apps exist (not mapped)	Low	High
D. Matatu revenue check	Owners	Many small tools, none dominant	Low	Medium: crews sabotage tracking
J. Boda repayment record	Lenders	Crowded lending lane	High (credit reference licensing)	Low

7. The recommendation: payer-confirmed receipts

Working name for the demo: **Thibitisha** (Swahili for “confirm”). Check the name is free before using it publicly; the brand stays in the BRAND_NAME setting so it can change.

7.1 The insight

Every M-Pesa till already shows the owner the money that reaches it. Nobody shows the owner the money that does not: cash, and payments sent to a caretaker’s or manager’s own number. The only other person who knows that payment happened is the payer. Your Shadow POS asked staff to report on themselves. This asks the payer instead, and keeps the staff log as the thing to check against.

7.2 How it works

Who	What they do	AT API
Payer (tenant, guest, member)	Dials the code, picks “Confirm a payment”, enters the place code (e.g. 4471) and amount, optionally the M-Pesa code, agrees to share their number with the owner, confirms. One session, four short screens.	USSD
Staff (caretaker, manager, treasurer)	Logs payments as today (the existing ussd-pos flows).	USSD
The system	Matches each payer confirmation to a staff log: same place, same amount, within 24 hours, or the same M-Pesa code.	-
On a match	Payer gets an SMS receipt. Where the template uses rewards (lodges), the payer also gets KES 10 airtime.	SMS, Airtime
On a mismatch	Owner gets an SMS: “Tenant 0712…345 says they paid KES 8,000 on 28 Oct. Caretaker logged KES 6,000.”	SMS
Owner	Dials in for today: confirmed, unmatched, and money at risk. Stretch: texts a question such as “nani hajalipa?” and gets an AI answer from the ledger.	USSD, SMS (+AI)
Later, in production	Voice call-back to the payer when a claim is disputed, recorded for the owner.	Voice

7.3 Why it should work

- **The mechanism is proven** by governments against shops (section 4). Our version points it at an owner’s own staff, where the owner, not a tax office, acts on the alert.
- **It meets payers where they are.** 27.4 million feature-phone devices in Kenya cannot run KRA’s receipt app; every one of them can dial USSD.
- **It is designed around Rwanda’s lesson:** one short session, no codes to memorise beyond the place code, a small certain reward instead of a draw.
- **It turns your weakest point into data.** A record confirmed by both sides is the “trusted record of daily cash” that funded survivors own, and the basis for the inventory or rent credit you originally wanted to reach.

7.4 Where to start: payers who already want a receipt

Template	Does the payer want a receipt?	Reward needed?	Owner pain	Order
Rent via caretaker	Yes: protection from “you didn’t pay” and eviction disputes	No	High: absent and diaspora landlords	1st
Chama contributions	Yes: members distrust treasurers	No	High: the group itself	2nd
Milk deliveries	Yes: farmers dispute litres and pay-outs	No	Medium: cooperatives	3rd
Lodge or bar guest	No	Yes, KES 5-10 airtime	High: your original owners	4th

7.5 Business model (assumptions to test)

Item	Rent template	Lodge template
Cost per confirmation	USSD ~KES 1.50 + SMS receipt ~KES 1 = ~KES 2.50	~KES 2.50 + KES 10 airtime = ~KES 12.50
Price	KES 50 per unit per month, paid by the landlord	Existing plans (KES 50-200/day) with rewards passed through at cost
Gross margin	About 94% (one confirmation per unit per month)	Driven by the plan; rewards are cost-neutral
Break-even on the KES 10,000 shared code + hosting	About 250 units, e.g. 12 buildings of 20 units	About 5 venues (UNIT_ECONOMICS.md)
Outcome-based option	1% of confirmed rent (KES 80 on KES 8,000)	1.5-2% of confirmed takings

USSD and SMS costs are from VALIDATION.md and UNIT_ECONOMICS.md; whether AT adds a fee on airtime is not verified.

7.6 Pre-mortem: why it could fail, and what to do

Failure	Mitigation
Payers do not bother.	Start where payers want receipts (rent). Send one SMS reminder after a staff log (“Did you pay KES 8,000 to Mama Njeri? Dial … to confirm”). Kill criterion: under 30% of tenants confirm after two reminders.
“Why not make everyone pay to my till?”	The strongest objection. Answer: many owners already try and fail, because caretakers need float, payers prefer cash or a familiar number, and rural places are cash. We cover exactly the money the till cannot see.
Collusion: staff give a discount for not confirming.	Rwanda saw price penalties for 30%+ of people. Tenants rarely trade proof of payment for a small discount; for lodges keep the housekeeping room count as a second check.
False claims to get staff in trouble.	Rewards only on a match, so there is nothing to farm. Each claim carries the caller’s number; rent templates only accept registered tenant numbers; limit claims per number per day.
Gambling law.	No draws or prizes: a guaranteed, equal reward per matched confirmation. Whether that falls outside the Gambling Control Act 2025 is not verified; get a lawyer’s view before running rewards live.
Data protection.	Ask for consent on the first screen, keep only phone, amount and time, and say who sees it. Check ODPC registration under the Data Protection Act 2019 before a live pilot.
Owners will not pay.	Two-week free period, then M-Pesa. Kill criterion: fewer than 2 of 4 pilot owners pay for month two.

8. The hackathon day

8.1 Before you start

- **Ask the organisers whether you may start from code written before the event.** If not, use this plan and rebuild from scratch; the design is the hard part.
- Have ready: AT sandbox username and API key, the USSD simulator open, ngrok working, a Postgres URL (or the in-memory store), Docker installed.

8.2 Build plan (adjust to the published agenda)

Block	Build	Done when
1	Data model: places, staff, payers, staff logs, payer claims, matches. Reuse the ussd-pos store interface.	Tests pass on the memory store
2	Payer USSD flow: place code, amount, optional M-Pesa code, consent, confirm.	A claim is saved from the simulator
3	Matcher, SMS receipt on match, owner SMS on mismatch.	Both SMS appear in the sandbox outbox
4	Airtime reward on match for the lodge template.	Sandbox airtime call returns success
5	Owner USSD menu (today: confirmed, unmatched, money at risk) and the rent and lodge templates.	Owner sees live numbers
6	Dockerfile, env vars, Marketplace listing, logo, screenshots, README.	Image builds and runs locally
7	Rehearse the demo twice with three simulator phones; three slides.	Demo under 3 minutes
Stretch	Owner asks by SMS (“nani hajalipa?”) and an LLM answers only from the ledger.	Correct answer on demo data

8.3 Demo script (3 minutes)

- **The problem (20 s):** “A landlord in Doha has 20 tenants. The caretaker says three didn’t pay. Who is lying? Today she cannot know.”
- **Tenant confirms (40 s):** dial, place code, KES 8,000, M-Pesa code, confirm; the SMS receipt arrives.
- **Mismatch (30 s):** the caretaker logs KES 6,000; the landlord’s phone gets the alert.
- **Same engine, a lodge (30 s):** a guest confirms KES 1,500, it matches, KES 10 airtime arrives.
- **Owner view (20 s):** “Today: 14 confirmed, 2 unmatched, KES 2,000 at risk.”
- **Why it matters (40 s):** Brazil’s receipt programme lifted reported retail revenue 21%+; Kenya has 27.4M feature phones that receipt apps miss; installs per business from the Marketplace, KES 50 per unit a month.

> **Pitch line:** “Every till sees the money that reaches it. Nobody sees the cash that doesn’t. The person who paid knows. We ask them.”

8.4 Marketplace listing draft

Field	Draft
Name / slug	Thibitisha (working) / thibitisha-payer-receipts
Short description	Let the people who pay you confirm what they paid, over USSD. Catch missing cash without relying on staff entries.
Long description	Tenants, guests or members dial a code to confirm a payment. Each confirmation is matched against what your caretaker or staff logged. Matches send the payer an SMS receipt; mismatches alert the owner instantly. Works on any phone. Templates for rent, lodges, chamas and milk centres.
AT products / industry tags	USSD, SMS, Airtime / Real estate, Hospitality, Financial services, Agriculture
Environment variables	AT_USERNAME, AT_API_KEY, USSD_SERVICE_CODE, SMS_SENDER_ID, DATABASE_URL, BRAND_NAME, TEMPLATE, REWARD_KES, MATCH_WINDOW_HOURS
Database	PostgreSQL, one database per instance (isolated per customer)
Pricing plans	Starter: KES 1,500/month, up to 30 units or rooms. Standard: KES 3,500/month, up to 100. Airtime rewards billed at cost.

9. Runner-ups and what to drop

- **SHA claims assistant for clinics** is the idea I would take to investors after the hackathon: big, painful, regulation-driven, and squarely in YC's "$15-an-hour expert" request. Next step: two clinic interviews to see a real rejected claim.
- **Chama confirmations** and **milk-centre receipts** should be shipped as templates of the same engine, not as separate products.
- **Matatu owner checks** stay interesting (M-Pesa till vs GPS), but they are an M-Pesa and GPS product, not an AT one, and crews cut tracking wires.
- **Drop for now:** eTIMS over USSD (KRA already covers it), boda repayment records (credit-reference licensing), voice agents (no sandbox voice).

10. Is this credible, and is anything new?

Where the evidence is strong and where it is thin

Strong (grade A)	Thin (grade B/C or unverified)
Kenya CA statistics; Naritomi's Brazil study (working paper and World Bank summary; published in the American Economic Review); IGC/J-PAL Rwanda work; KRA's own campaign terms; YC's RFS page; Partech's report; AT's blog posts.	YC Africa counts reuse one 2024 snapshot; the "60% AI" figure is from a vendor page; AT Marketplace payout terms are undated and incomplete; whether rewards fall under gambling law is unverified; the Brazil figure is 21% or 23% depending on the draft; no Kenyan field test of payer confirmation exists yet.

What I learned that I did not know going in

- **Certainty beats size.** Rwanda's big-prize, three-code SMS lottery failed; people asked for small, frequent, certain rewards. That single finding sets our design.
- **The feature-phone gap in Kenya's own receipt programme.** KRA's 2024 campaign was app-only while 27.4M feature-phone devices remain.
- **YC's Africa intake fell from 24 in W22 to about 3 per batch**, and its current requests ignore Africa. That changes the funding plan, not the idea.

- **AT says it takes no cut on the Marketplace** and bills installs itself, so AT's existing customers are a free sales channel.

The gap

Governments use payers as auditors against businesses for tax. In the sources read, nobody offers it to a private owner to check their own staff, over USSD, for cash and personal-number payments. That is a real gap with a caveat: not finding a competitor in desk research is not proof none exists. Ten conversations with landlords and lodge owners will tell you more than another report.

> **Is it worth doing?** Yes, as the hackathon build and as a four-week pilot with two landlords and two lodges. It becomes a business if tenants confirm without rewards and owners pay in month two. It becomes a venture only if the confirmed records later support credit or rent references. That is a second step, not the pitch.

11. Useful code and starting points

Resource	Why it helps	Checked
Your ussd-pos (/mnt/project-files/ussd-pos)	Tested USSD router, staff flows, Postgres store, SMS, owner alerts. Most of blocks 1-3.	Yes, 25 tests passing on 14 Oct
africastalking on npm (AfricasTalkingLtd/africastalking-node.js)	Official Node SDK, latest 0.8.4. Airtime, SMS, Voice helpers.	Package registry, 28 Oct
africastalking on PyPI (AfricasTalkingLtd/africastalking-python)	Official Python SDK, 2.0.3.	Package registry, 28 Oct
Google-Africastalking-AI-Course (DaggieBlanqx)	Flask + Gemini + AT SMS and Voice; pattern for the stretch AI feature.	Docs read; repo host not confirmed
VoicePact (mutuiris)	Example of handling AT voice webhooks and recordings, for a later Voice dispute feature.	Docs read; repo not opened
Matatu SACCO projects (rosaga/Ematatu-Sacco-System, StephenKairu/e-matatu-system)	Student examples if you return to the matatu idea.	Listed in earlier research only

GitHub itself could not be opened from this workspace, so only the package registries confirmed the SDKs.
